

As a potential homeowner, I would like the app to have a visual of rat density within an area in order to determine places of high infestation.

Tasks:

- I. Connect to google maps
- II. Create filter in order to show sightings based on the date plotted
- III. Access the sent rat report pins to display based on date
- IV. Create touch access for pins in order to see more indepth information

Acceptance Scenarios:

GIVEN: The user has entered the map WHEN: the user clicks a specific pin THEN: the data from that pins sighting will be shown

GIVEN: the user has entered a valid data range WHEN: they enter the map THEN: the map will display pins for all the sightings within the time frame

Done Done:

- Google maps integration tied into app interface with proper aesthetic
- indepth information windows automatically populated with detailed information on a specific location
