

As a potential homeowner, I would like to use the information from (Rat app name) to determine if a specific location is rat infested.

Tasks:

- I. Create option and page for viewing the historical sighting report
- II. System will prompt user for setup information such as date ranges for sightings
- III. System will pull information from sighting list in order to determine sightings per month
- IV. App will display graph of number of sightings vs months

Acceptance Scenarios:

GIVEN: The user enters an acceptable date range WHEN: The user enters the information

THEN: the application will display a graph of the given information and number of rat sightings

GIVEN: The user enters an unacceptable date range WHEN: the user enters the information

THEN: The app will notify the user of invalid dates

Done Done:

- Graphs are displayed properly and tie into UI well.
- Graphs pull info from SQL server once implemented
