

As the user of the app, I would like to have a secure login, so that I can have a differentiated account.

Tasks:

- I. Create a page containing a way to enter username and password
- II. Check login information for correctness
- III. Link login page to application
- IV. Allow cancellation of the login

Acceptance Scenarios:

GIVEN: The user enters the correct username and password WHEN: they press the login button
THEN: The app proceeds successfully to the application

GIVEN: The user enters an incorrect username or password WHEN: the user presses the login button
THEN: The user will be notified that it was a bad login

GIVEN: The user wishes to cancel the login WHEN: They return a page or press cancel THEN:
Their information will not be recorded and they will be closed out of the login attempt

Done Done:

- Login tied to user database
- Login system allows for registration of new users
