As a user of the app, I want to register an account, so I can easily access and enter information to the rat database.

Tasks:
I. Create registration screen XML
II. Implement registration code and link to XML.
III. Connect registration to user database
IV. Enable access to registration from login screen via button

Acceptance Scenarios:
GIVEN: A user desires to create an account, WHEN: they attempt to access the registration screen from the login screen, THEN: the registration screen is opened appropriately.
GIVEN: A user has input their information into the registration screen, WHEN: they tap the Register button, THEN: a unique user is created and added to the database.
GIVEN: A user inputs data to the registration screen that belongs to a previous user, WHEN: they tap the Register button, THEN: a warning message will appear, not allowing them to use already owned user information.

Done Done:
-SQL Server is fully integrated to registration process.
-Login System is merged to Github repository.
